The Process of a Systematic Review and Meta

Eligibility criteria As pragmatic language difficulties present at a very young age in children with ASD and persist into adulthood, it is necessary for therapists to provide pragmatic language interventions to children throughout their development. The review will describe the studies reporting on pragmatic language interventions for children with ASD and the characteristics of the included interventions, and evaluate the methodological quality of the included studies.

The Process of a Systematic Review and Meta

Such a large N-value indicates a low risk of publication bias.

A systematic review of pragmatic language interventions for children with autism spectrum disorder

Interrater reliability between the two independent assessors was established for both the abstract selection and Kmet ratings of each included study. In: Guyatt G, Rennie D, Meade MO, Cook DJ.

Guides for Reading and Interpreting Systematic Reviews: I. Getting Started

Millard T, Elliott J, Girdler S. A random effects model was used to generate effect sizes as the included studies are not likely to have the same true effect due to the variability in the sampling, intervention characteristics, skills targeted, participant characteristics and outcome measures utilised. Further, group interventions appear to be more effective than those delivered one-on-one, and the inclusion of typically developing peers may have the potential to increase the effectiveness of group interventions.

For all sub-group analyses the Hedges g formula for standardised mean difference SMD with a confidence interval of 95% was used to report effect sizes. A further 29 records were identified via Google Scholar, autism specific journals, speechBITE, and SpeechandLanguage. A randomized controlled trial of preschool-based joint attention intervention for children with autism.
