Kidney Cortex Necrosis

D- HUS has been associated with various nonenteric infections, viruses, drugs, malignancies, transplantation, pregnancy, and other underlying medical conditions such as scleroderma and antiphospholipid syndrome. In cases of a prolonged disease the kidneys appear decreased in size and there is narrowing of arterial lumina.

Diffuse Renal Parenchymal Diseases

What causes renal artery disease? The most common causes are obstetric complications such as abruptio placentae, eclampsia and septic abortion; but it is also seen in other instances such as haemolytic uremic syndrome, snake venom, intravascular hemolysis, severe graft rejection, and circulatory collapse of any case.

Renal artery stenosis

High-dose intravenous acyclovir can cause AKI in the volume-depleted patient as a result of intratubule precipitation of crystals, clinically characterized by colic, nausea, and vomiting. There is also vacuolization of mesangial and endothelial cells, increased mesangial matrix, usually without or with slight mesangial hypercellularity; sometimes mesangial interposition and double contour of the capillary walls most common in severe cases or in the resolution phase are evidenced.

Vascular_Diseases

To see these crystals is necessary to cut fresh frozen tissue and to see it with polarized light.
