Antipyretic Therapy: Physiologic Rationale, Diagnostic Implications, and Clinical Consequences

If external cooling is used to treat fever, care must be taken to prevent shivering because of its associated increase in oxygen consumption. Sections A and E show response at 0 minutes; sections B and F show response at 1 minute; sections C and G show maximum response; and sections D and H show the total area under the curve AUC above baseline. The present review considers these issues in light of currently available data and formulates guidelines for antipyretic therapy based on these data.
