Water Characteristics of Contrasting Soils in the Chiltern Hills and their Significance for *Deschampsia Caespitosa* (L.) Beauv. on JSTOR

The distribution of particular cytotypes is shown in see also : *Aster amellus* agg. Eventually, populations developed the familiar long neck of modern giraffes.

Deschampsia caespitosa

Logan, UT: Utah State University.

Plants Profile for *Deschampsia caespitosa* (tufted hairgrass)

Species that become dominant for only one to several years e. Interestingly, air quality has greatly improved over most of western Europe in recent decades, largely due to clean-air legislation that has reduced the use of coal as a source of energy.

Influence of fertilization on microbial activities, soil hydrophobicity and mineral nitrogen leaching

Ecology of cytotypes To test whether differences in ecology between the two ploidy levels exist, one-to-three relevés depending on the size of the population were recorded in each locality with the exception of localities No. The cover data of all species recorded as percentages were square-root transformed before the analysis. Traditionally, it has been assumed that there are only diploid populations in Bohemia the western part of the country and only hexaploid populations in Moravia the eastern part of the country; see Löve, 1974; ,.
