Soil management

Agronomy Journal, 105 3 , pp. Decomposing organic matter improves soil permeability and increases stable aggregates.

New Science Synthesis on Soils and Soil Management

Compaction causes pans and restricts the ability of roots to penetrate deep into soils, it also reduces water infiltration, causing higher levels of run off. These soils have a white crust of salts on their surface.

Soil Management

This is because the plant roots contain varying concentrations of ions salts that create a natural flow of water from the soil into the plant roots. Figure 1 shows how the various salt concentrations affect the movement of water from the soil to plants. Each type of soil has unique properties that require special management.

Soil Management

The higher the CEC, the more problematic the removal and remediation of the salt problem. This is why some plants can continue to thrive when others have died.
