Correlation of in vivo positron emission tomography and in vitro autoradiography measurements using radiotracers for the dopamine system

The rat P450c17 gene is regulated by multiple orphan nuclear receptors. To the right a BRET 1 saturation curve for the A2A—D2 hetero receptor complex D2LR Rluc + A2AR YFP, filled circles is shown giving BRET max and BRET EC50 values.

The role of M1 muscarinic receptor agonism of N

Abstract: Tardive dyskinesia develops as a common complication of long-term neuroleptic use. The mesencephalic dopaminergic neurons have key roles in sensorimotor integration, motor behavior and in the modulation of behavioral responses to positive and negative reinforcement. Thus, the possible pivotal role of ERK1 on the behavioural effect exerted by both dopaminergic and opioid system can not be ruled out.
