The author suggests: 1 the economic rationality of American democracy has tended to lead to economic concentration; a waste of natural resources; and environmental degradation also an inequitable distribution of wealth, but this subject is scarcely touched upon ; 2 business imperatives, rather than environmental or social concerns, and technological developments have increased the exploitation and processing of natural resources; 3 at the same time, the nation has become increasingly tied together through cheap transportation and regional specialization of resource extraction or processing; and 4 American political policy and legal institutions have generally supported the logic of private enterprise development, promoting and defending individual private property rights over social and environmental concerns, eschewing control of private lands even for purposes of conservation; and also providing abundant government assistance for the profitable purposes of agriculture, lumber, oil, and mining interests. Industrial organization in the mineral industries.
