The similarity between the two is both can test and confirm USB port function. The reason is it provides both magnitude and phase information. A typical USB tester uses an LED color as an indicator or status.

People mainly use this instrument to test the USB connections to find problems with ports, phones, cables, or chargers. There are two types of speedometers: 1 mechanical speedometers and 2 electronic speedometers. Every single thing described above is the common thing to know in electronic measurement.
