Ask a parent or guardian to help you if you're stuck! Notably, there are no dinosaurs. The leaves are much larger at this level and insect life is abundant. They are considered one of the due to their power of being able to squeeze and crush such large animals — some people believe that an anaconda would win a fight with a gorilla! Explore different types of habitats and microhabitats with this curated collection of classroom resources.

Rainforest Animals: 13 Iconic Rainforest Species Examples ✓ □

However, scientists disagree on how many biomes exist. According to Carvalho, the relative lack of humidity in earlier forests means that the regions were likely much less productive than they are today. As a result, its main industry is agriculture.

15 rainforest facts

The habitat contains all an animal needs to survive such as food and shelter. The first is that the demise of the dinosaurs caused the forests to grow more dense—there could have been fewer animals consuming the plants or stomping through the brush, allowing foliage to grow relatively unchecked. Looking at these fossils allowed the team to get a sense of the types of plants present both before and after the asteroid struck the planet.
