## The invasive gastropod *Crepidula fornicata* : reproduction and recruitment in the intertidal at its northernmost range in Wales, UK, and implications for its secondary spread

A certain amount of water movement, on the other hand, is needful to provide oxygen content for life processes, while tidal sweep and local currents play a considerable part in faunal distribution. In the mud washed from dredgings taken in ten to twenty fathoms off Eastport, Maine, in the Bay of Fundy, by W. In contrast to external morphological variability, the internal reproductive structures of *Grateloupia* are remarkably homogenous, with conical auxiliary cells and carpogonial branches occurring in separate ampullae.

### CAB Direct

Our meetings have, I apprehend, a value quite independent of the papers for the evening, in the meeting of men of similar tastes, in the discussions which some oral communication may evoke, and, above all, in the arrangements by which the instruments of our research are always on the table for the purposes of experiment and observation.

### ADW: *Asterina gibbosa*: INFORMATION

Small oval cavities were observed on the third and fourth days on the outgrowths, not separated by partition-walls, which increased in size ; and on the sixth day a luxuriant growth of the *Penicillium glaucum*, or other species of mould, entirely covered the Favus fungus ; and further observation could not be made. Works on Crustacea, including Milne-Edwards' 'Histoire;' Desmarests' 'Considérations;' Roux, 'Crust. Gregory as a chemist has been recorded by others, and I have only here to allude to him as a microscopist.

### ADW: *Asterina gibbosa*: INFORMATION

It has been suggested to dissect the frond at a pre-determined distance from the distal end 10 cm for F. Professor Gregory suffered from an ailment which prevented his walking or standing. A coil of this is held loosely in the left hand.

Fredericq 1889 finds that the blood of the shore crab {Carcinus mènas has a salt content which varies with the degree of salinity of the water in which the animal is living. It is obvious, moreover, that the shells of terrestrial species, accidentally mixed with the others, could not possibly have been drifted to such a place as the foundation of a heap of mould, seven feet in height and forty-five in diameter.
