LIPODERM®

Selection of the gelling agent clearly influenced the efficacy of SA delivery from all formulations. Physiologically based pharmacokinetic models of trichloroethylene and its oxidative metabolites. Some pesticides, such as dieldrin and atrazine McMullin et al.

Appendix B: Pharmacokinetics and Metabolism of Pesticides

In fact, the patented Lipoderm core technology has also led to the development of an entire line of transdermal bases. Xenobiotic-metabolizing enzymes and their isozymes are distributed widely throughout the body.

Percutaneous Absorption Services

The parent compound, for example, is responsible for the neurotoxic action of pyrethroids. Structure activity relationships involved in the percutaneous absorption of n-alkanols, phenols, phenylboronic acids, steroids, nicotinic acid esters, alkanic acids, polynuclear aromatic compounds, and nonsteroidal antiinflammatory drugs were discussed.
