## Corticosteroids for Inflammation

Appropriate use of inhaled corticosteroids is of the utmost importance to obtain maximum benefit without increasing risk unnecessarily. To enable use of lower corticosteroid dosages, companion use of non-steroidal anti-inflammatory drugs began in the late 1950s, with phenylbutazone the first. Conclusion: Mood and cognitive changes with corticosteroids appear to be common but generally mild and reversible side effects.

## Cortisone shots

Most subjects reported some symptoms, including depressed or elevated mood, irritability, lability, insomnia, increased energy, anxiety, or depersonalization, but no group mean changes in psychiatric rating scales could be demonstrated perhaps due to the heterogeneity of symptoms. Studies were of variable quality with only about half of the studies at low risk of producing biased results. One study suggested lithium therapy may prevent corticosteroid-induced psychiatric disturbances.
