Normal or bizarre mitoses are present. VAHLENSIECK In recent years tumors of the male genital system have acquired a new scientific importance in many respects: First, epidemiologic studies have revealed a striking increase of prostate carcinoma in northwestern Europe and in the USA; it is now counted among the most frequent malignant tumors in males. Microscopically, the tumor presents severe pleomorphism with abundant collagen fibers.

### IARC Publications Website

Among adolescents and young men, germ cell cancers of the testis predominate, but decline rapidly in occurrence after 40 years of age. The diagnosis of azoospermia may be determined only after a semen specimen is centrifuged at 300 g for 15 minutes, with microscopic examination of the pellet.

### IARC Publications Website

Sometimes, cells are fusiform, poorly outlined and arranged in a palisade pattern. Cells are small, enclosed in nests with scant cytoplasm, arranged in multiple rows. AMH is secreted by somatic cells only in both sexes: Sertoli cells in males and granulosa cells in females.

### Urogenital cancers

In chronic evolution forms, especially in adult breeding bulls, the tumor is predominantly fibrous, poorly cellularized and vascularized, with thick collagen fibers —. In general, the stroma is reduced; sometimes it can delimit pseudolobules by vascular connective tissue.

## **Urogenital cancers**

Mesenchymal tumors The more frequently diagnosed primary mesenchymal tumors are: leiomyoma, fibroma, fibrosarcoma and leiomyosarcoma.

## **Male Genital System**

The secreted amount of AMH is inversely correlated to the degree of Sertoli cell maturation.

### **Tumors of the Male Genital System / Edition 1 by E. Grundmann**

Multiple nodules of alveolar shape, with neoplastic cells that proliferate from the basal membrane and fill the lumen, may be identified in the tumor mass.
