A significant emphasis is given to the physical modeling background, instrument potential and limitations, inversion methods and applications. Interwoven within these concepts, processes, and principles are hundreds of photographs, illustrations, real-world examples, and applications that make the material relevant and accessible and maybe sometimes even entertaining by bringing the science to life. The goal of the book is to provide a broad panorama of spaceborne remote sensing techniques, at both microwave and visible-infrared bands and by both active and passive sensors, for the retrieval of atmospheric and oceanic parameters.
