

Population, employment and housing units - projections to 1990 for the Pacific Northwest

The Branch - Portland Housing Market:

Pacific Northwest (75% in Washington, 17% in Oregon and 5% in Montana). However, an analysis found that with a multiplier effect over 17,600 jobs were lost (Bickus and Kleeman, 2000). This multiplier effect includes positions lost at companies that sold products or services to the aluminum smelters and also the impacts of reduced disposable income in the communities.

Long-term projections estimate that while the impacts of these closures will be minimal when viewed from a regional or state level, that they will be pronounced at the county level. As the result of the industry contraction, Klickitat County, Washington, is expected to lose nearly 18% of its population by 2020, and Wasco, Oregon, is predicted to see about half of that, with a total loss of about 8.5% of its population.

EXAMPLE 2: The Pacific Northwest Timber Industry

For another example of an economic disaster in rural communities, we might look at the timber industry in the Pacific Northwest in the 1980s and 1990s. Timber had been an economic mainstay for much of the region's history, and in 1988 lumber and wood products accounted for 10% of Oregon civilian employment (Weeks, 1990).

Beginning in the late 1970s, the timber industry underwent significant changes in response to market, environmental, and technological shifts, including increased foreign and domestic competition, stricter interpretation of federal laws,⁷ and a changing public view of how national forests ought to be managed (Conway and Wells, 1994). Between 1979 and 1988, the timber industry in Washington and Oregon cut more than 25,000 jobs as mills closed across the region (Pisiot, 1993). This trend continued into the 1990s.

⁷ In particular, the Endangered Species Act which began a battle between industry and protection of the Spotted Owl.
