National Museum of Canada. Natural history papers, Crab-like Anomura and Brachyura (Crustacea; Decapoda) from southeastern Alaska and Prince William Sound

Notes: Bibliography: p. 5-6.

This edition was published in 1968

How do crustaceans become crabs?

Journal of Crustacean Biology 21 4 : 1062-1076. There would need to be predators for the organism to protect itself or hide from, plus a good variety of food.

intermediate forms between macruran and crab-like forms, or as being half-carcinized ; but see.

On Earth, things evolve into crabs—could the same be true in space?

Pleonal ganglia The cephalothoracic ganglion is connected with pleonal neuromeres pn2—pn6 via paired connectives. This could make them smaller targets for predators and could allow the crabs the ability to run and hide in smaller crevasses. There are also terrestrial false crabs, such as the terrifying coconut crab.

How does a crustacean become a crab?

PDF from the original on 2018-07-21. Formed over time, it identifies the timing of major evolutionary novelties and bodyplan origins. Fused thoracic neuromeres are found in representatives of slipper lobsters Achelata and caridean shrimps.

A guide to the fossil Decapoda (Crustacea: Axiidea, Anomura, Brachyura) of the British Isles

How to become a crab: Phenotypic constraints on a recurring body plan. This work was supported by the National Science Foundation DEB 1856679, DEB 1856667, and a National Sciences and Engineering Research Council of Canada NSERC Post- doctoral Fellowship.

In Kiwaidae, the pleon is strongly bent, also hiding the third and fourth pleonal segments.

How does a crustacean become a crab?

In a paper published on March 12 in BioEssays, a team of researchers led by Harvard University found that the crab-like body plan evolved at least five times independently in both true crabs Brachyura and false crabs Anomura. In the other taxa, the hepatopancreas fills most of the cephalothorax and the degree to which it extends into the pleon varies from taxon to taxon. Morphological characters such as the left-sided, unpaired pleopods and the asymmetrically arranged tergite plates in female king crabs were interpreted as remnants from a hermit crab-like ancestor , , ;
