Spin Dynamics

The two jumps destructively interfere as the polarization makes 4 complete oscillations during the time between the two jumps. In particular, for the electric dipole moment measurement, it is important to quantify the field errors systematically.

The lower figure shows the polarization $P \propto \theta$ as the particle makes the resonance crossings.

Suppressing intrinsic spin harmonics at the cooler synchrotron COSY

In this case, the four children move in a more serpentine fashion, with one in the lead and the others following but always slightly behind in their motion.

This paper is to address these two effects.

This approximate picture, however, ignores two spin dynamics effects: an interference-overlap effect and a spin echo effect. Authors and Affiliations Cite this chapter as: Minty M. Previous studies have shown that it can be further improved by sextupoles, which correct the second order effects related to the chromaticity of the beam.
