The experimental part involves tests of ten different DP590 and DP780 steel grades with three different shear cut qualities. A represent volume element RVE method combined with crystal plasticity model is established to investigate the effect of shear bands on the anisotropic fracture behaviours systematically by considering the grain size, texture, width, and tilted angle.

Sheets of light-weight alloys, such as aluminum alloys and magnesium alloys, are expected to be used more for interior or exterior panels of passenger cars.

Within the short transport time the part can be fully covered by an optical system. The dimensions of rings used by them were in the ratio 6:3:2 outer diameter: inner diameter: thickness.
