Molecular Pathology of Cholestasis

In addition, localization of transporters to the cell membrane may be disrupted due to changes in microtubules. In some cases, the actual P value is presented. Black arrowheads indicate hepatic steatosis; white arrowheads indicate cytoplasmic clearing and severe hepatocyte swelling.

The molecular pathogenesis of cholestasis in sepsis

Intrahepatic cholestasis of pregnancy (ICP) is a reversible form of cholestasis in late pregnancy, persisting until delivery.

Molecular Pathogenesis of Cholestasis

BA profiling using ultra-HPLC—mass spectrometry For BA profiling, 20 µL of serum was mixed with 60 µL of acetonitrile 1% NH₄OH , including lithocholic acid-D 5 as the internal standard, and supernatant was separated by centrifugation. Additional types of PFIC with TJP5 and NR1H4 mutations have recently been designated PFIC4 and PFIC5, respectively. Cholestasis, defined as a hereditary or an acquired disruption of bile flow, is a liver disease caused by reduced bile acid BA efflux from hepatocytes intrahepatic or bile duct obstruction extrahepatic , resulting in BA accumulation and serious liver injury.

Intrahepatic cholestasis of pregnancy

New cases and follow-up from infancy to adult age. Pruritus itching is a common symptom of pregnancy, affecting around 23% of women.
