Map

The projection is often used for marine navigation because all straight lines on the map are lines of constant azimuth.

## **2(a). Introduction to Maps**

The poles, which are represented by a point on a globe, are expanded to have the same circumference as the equator.

Map

Projection: Geographical relationship of the ellipsoid, still three dimensional form, are transformed into two dimensional plane of a map.

location of more control points

There are normal, transverse, and oblique cylindrical equal-area projections. For plane coordinate use a false Easting and Northing of 1,000,000 meters were defined for the origin.

### **Map projection**

Other versions of this projection may keep the oceans somewhat intact, but then the continents are disrupted. This distorts distance, shape, and the size of areas. Such lines were little used until the mid-19th century, mainly because surveys had not generally been made in sufficient detail for them to be employed successfully.
