MAT 265: Calculus & Analytic Geometry I
Test I Practice

1. The following points lie on the graph of $f(x) = x^2 - 2x$: $P(-1), Q_1(1.9, f(1.9)), Q_2(1.99, f(1.99)), Q_3(1.01)$, and $Q_4(1.01, f(1.01))$. Find the slope of the secant line through Q_1 and P , Q_2 and P , and Q_3 and P , and so on (round your answers to four decimal places). Use your results to estimate the slope of the tangent line to the graph of f at the point P . Describe how your estimate could be improved.

2. Let $f(x) = \frac{1-10x}{x}$. Complete the table below (round your answers to four decimals) and use your result to evaluate the limit $\lim_{x \rightarrow 0} f(x)$.

x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1

Many of the problems require similar skills to solve but there are more structured questions in many exercises that have relevance to a physics or mathematics problem or a concept from these fields of study. I hope this was helpful.

This chapter is crucial for the future study of electromagnetism and thus, I would recommend that any serious student of physics should spend ample time on this chapter. Here, you will find the epsilon-delta stuff that mathematicians love to talk about.

In particular, you are not allowed to use a cell phone or otherwise have private conversations with others during class. The following two chapters focus on Integration and its applications.

There is also a class of integrals called Lebesgue integrals. I had learned calculus before when I was in O levels but this book presented the

foundations of calculus and the application of the various techniques very well.

Use it for reference whenever you need it, and don't be afraid to use the index: it is easily the most important section of any mathematics text. The fifth chapter establishes the notion of the Riemann integral which is the mathematical name of the integral that most of the physics and engineering students do but it's not the only type of integral. First, online solutions make grading far more efficient: instead of writing the same corrections on numerous manuscripts, I simply identify the points at which a solution goes awry.
