```
class B {           // B is a base class
public:
    void base_func1(); // Public member functions, inherited
    void func2();      // by classes derived from B
};

class D : public B { // D is derived from B
public:
    void func2();     // D redefines func2
};

void test() {
    B b;            // Create instance of B
    D d;            // Create instance of D
    d.base_func1(); // Call base_func1 defined in B
    b.func2();       // Call func2 defined in B
    d.func2();       // Call func2 defined in D
}

Program 5.2 : A program illustrating inheritance in C++. The class D is
derived from the class B. The function test creates instances of these classes and
calls the functions that they define.

## C Programming

This is the best book by far. The function In this case, the function body contains three statements out of which only the printf line is an executable statement. It is also possible to produce two or more lines of output by one printf statement with the use of newline character at appropriate places.
