### Self

The BBC is not responsible for the content of external sites. Many *Viola* species and some *Salvia* have these types of flowers. Another mixed mating system is referred to as dimorphic cleistogamy.

### Flower structure

Many flowers, such as kiwifruit, have lots of ovules in their ovary, so their fruit contains many seeds. The ovary develops into a fruit to protect the seed. At the site of contact, fusion causes the formation of a.

### Pollination and fertilisation — Science Learning Hub

Flowers have different shapes, colours and smells, and often sugary nectar and nutritious pollen, to encourage animals to visit and pollinate them. After the female gametes are fertilised by male gametes from the pollen, the female cones produce seeds, which are then scattered away from the plant by wind or animals.

### Self

Of these, one is the egg cell; it fuses with a sperm cell, forming the. There are two conflicting theories on how the couple meiosis—fertilisation arose. This cell may then divide to produce dikaryotic or heterokaryotic.

### Flower Facts for Kids

Sperm and ovum fusing Fertilisation or fertilization see , also known as generative fertilisation, syngamy and impregnation, is the fusion of to give rise to a new individual organism or offspring and initiate its development.

### Flower

Plants that reproduce by seeds Seed plants have special structures on them where male and female cells join together through a process called

fertilisation.

## **Self**

This research addresses the question of how the and the appropriate egg find each other and the question of how only one sperm gets into the egg and delivers its contents.

## **Flower structure**

Cross-fertilisation and self-fertilisation represent different strategies with differing benefits and costs. Most people think that flowers are beautiful. Processes such as or which happen before the fusion of gametes are also sometimes informally called fertilization.
