They grow in pairs, except for the end leaflet which grows by itself. Any timber component destined for selling should ideally be marketable, high quality favouring deciduous , fast and straight and upright growing, deep rooting, wind firm and suited to the site.

Coppicing—cutting down a tree and harvesting the shoots from the stump four to eight years later—goes back to the Neolithic, about 10,000 years. In the winter, male catkins and female cones dangle from the branches. Two conditions were important for the growing influence of this region: the first is the long coastline of Asia Minor and Greece and the many islands scattered along these coasts; secondly the availability of timber.
