There are different estimation techniques that can be used in SEMs in general, and LGCA in particular.

. To determine the extent to which SES and gender predict latent class, pseudo-class draws were used for a posterior-probability-based multinomial logistic regression of the latent class variable on SES and gender.

Graphical & Latent Variable Modeling

LVMM is part of a latent variable modeling framework ; and is flexible with regard to the type of data that can be analyzed. The paper illustrates differences between MLM and LGCA when certain assumptions are violated and also shows examples where LGCA is preferred over MLM and viceversa.

conducting LVMM analyses may facilitate the use of this analytic technique by pediatric psychologists. We can use those component loadings to approximate the correlation matrix, or reproduce it exactly if we retain all the components possible.
