IMMS

Manganese nodules Covering huge areas of the deep sea with masses of up to 75 kilograms per square metre, manganese nodules are lumps of minerals ranging in size from a potato to a head of lettuce. IMMS archives the UMC abstracts at , the online digital library beta for the entire mining and minerals community.

Global Marine Mineral Resources

Global Oceans, Global Research Much like on land, marine geologic formations do not respect international boundaries, so the USGS has partnered with other agencies and international organizations to learn lessons that can be applied to domestic resources.

Marine minerals « World Ocean Review

Here, we conducted a continental-scale survey of seven geologically. Nodules are currently of great interest for mining due to high concentrations of manganese, nickel, copper, and sometimes lithium, as well as the straightforward nature of quantifying their distribution and density. Baleen whales are the most endangered species of whales.
