Staffing levels & Workload

A critical first step in any workload assessment is the formation of an advisory committee to oversee the project and provide guidance on policy mat ters, such as the definitions of case types and the division of the workday between case-related and non-case-related work. By weighting cases to account for the differ ences in judicial workload associated with each case type, the weighted caseload formula provides an accurate assessment of judicial need that accom modates variations in caseload composition, both over time and across jurisdictions.

Staffing levels & Workload

As just noted, for example, there is very little information on differences between individuals Damos, 1988. A judicial work load assessment conducted in 20014 concluded that California needed more than 300 additional judges to handle its total judicial workload—an increase of approximately 15 percent.

Like other psychophysiological techniques, the general form of inquiry is a search for a relationship between some measurable facet of central nervous system activity and some concomitant behavioral phenomenon. Over the course of more than a decade, the state legislature funded very few additional judgeships. The weighted caseload approach is also capable of accommodating other factors that impact judi cial resources, such as the amount of time avail able for each judge to hear cases, which may vary a mong courts within a state.

The day value is then translated into a year value, which represents the total amount of time one judge has available for case-related work over the course of one year. The time study data also guide the advisory com mittee in selecting the day value, or the amount of time each judge spends working on cases on a daily basis. Business process management, or BPM, is the practice of analyzing and improving business processes.

Therefore, the cognitive workload scale is best seen as a continuum in which too much and too little are liable to result in problems.

Workload Assessment: A Data

This is a great way to increase engagement and set expectations from the outset. Damos 1988 in her review of the area, could only find six studies that dealt with factors associated with individual differences and experienced workload. That these could be easily incorporated into head-mounted displays is a systems question for future design.

For example, evoked potentials have always held particular promise, but they are accompanied by a number of problems see Humphrey and Kramer, 1994.
